Totals (excluding escaped or non-naturalised feral exotic species)

Number of species recorded in 10-year period: 180, of which 67 are thought to have bred.

Number of species recorded since records began in 1921: 224

Richmond Park is an ancient parkland with an area of almost 2,500 acres (1,000 hectares) comprising diverse habitats such as ancient trees and decaying wood, grasslands, bracken, wetlands and waterbodies (including the Pen Ponds). Consequently, it attracts a wide variety of birds, both resident and migrating. The populations of some species resident in the Park, namely skylark, little owl, jackdaw, all three woodpeckers, reed bunting and stonechat, are significant in the London context. As these records show, some species are in decline locally, as well as nationally, but the Park can often reward the alert observer, occasionally with a species never before or rarely seen within its confines or airspace
